| Summary:                 |   |   |

$$\Rightarrow a * b = c$$

Hence,  $*$  is a binary operator

$\hookrightarrow *$  is binary operator if & only if  $(a, b, c) \in S^3$

$\hookrightarrow *$  is not binary operator if any one element  $\notin S$ .

like,  $(a, b) \in S$  but  $c \notin S$

① Closure :- A set  $S$  is closed w.r.t. a binary operator if, for every pair of elements of  $S$ ,

the binary operator specifies a rule ~~exist~~ for obtaining a unique element of  $S$ . For eg -

$$N = \{1, 2, 3, 4, \dots\} \rightarrow \text{set of Natural nos.}$$

- $N$  is closed w.r.t. binary operator + (addition)

i.e  $a + b = c$  (for every pair)

- $N$  is not closed w.r.t. binary operator - (subtraction)

i.e  $a - b \neq c$  (for every pair).

$$3 - 2 = 1, \text{ here, } 1, 2, 3 \in N$$

$$\text{and, } 2 - 3 = -1, \text{ here, } 2, 3 \in N \text{ but } -1 \notin N$$

② Associative Law :- A binary operator  $*$  on a set  $S$  is said to be associative whenever,

$$(x * y) * z = x * (y * z) \quad \forall x, y, z \in S$$

|  |  |                          |
|--|--|--------------------------|
|  | White Board Plan<br>Digital Logic Design (UNIT- )<br>Lecture no:       | Teaching<br>Methodology: |
| Date:  |  |                          |
| Today's Topics:  |  |                          |
| (3) <u>Commutative Law</u> :- A binary operator $*$ on a set $S$ is said to be <del>associative</del> whenever,<br>$x * y = y * x \quad \forall x, y \in S$  | Industrial Applications:<br><br><br>                                   |                          |
| (4) <u>Identity element</u> :- A set $S$ is said to have an identity element w.r.t. a binary operation $*$ on $S$ if there exists an element $e \in S$ with the property that -<br>$e * x = x * e = x \quad \forall x \in S$ | Practical Applications:<br><br><br>                                    |                          |
| Text Books:  | Class Activities:<br><br><br>  |                          |
| 1. Digital Design, 4th edition, by M. Monis Mano Pearson Education Inc.<br><br>2. Donald D. Givone (2002), Digital Principles and Design, TataMcGraw Hill  | Summary:<br><br><br>   | (2)                      |
| Reference Books:   |  |                          |
| 1. C. V. S. Rao (2009), Switching and Logic Design,  | $x \in S$ , there exists an element $y \in S$ such that<br>$x * y = e$ |                          |

Eg. In the set of integers,  $\mathbb{Z}$ , and the operator  $+$ , with  $e=0$ , the inverse of  $a$  an element  $a$  is  $(-a)$ , since

$$a + (-a) = 0$$

⑥ Distributive Law:- If  $*$  and  $\cdot$  are two binary operators on a set  $S$ ,  $*$  is said to be distributive over  $\cdot$  whenever

$$x^*(y \cdot z) = (x^*y) \cdot (y^*z)$$

Eg.  $a \cdot (b+c) = (a \cdot b) + (a \cdot c)$

### Summary

- 1) The binary operator  $+$  defines addition.
- 2) The additive identity is  $0$ .
- 3) The additive inverse defines subtraction.
- 4) The binary operation  $\cdot$  defines multiplication.
- 5) The multiplicative identity is  $1$ .
- 6) For  $a \neq 0$ , the multiplicative inverse of  $a = 1/a$  defines division.
- 7) The only distributive law applicable is that of
  - over  $+$  :-  
 $a \cdot (b+c) = (a \cdot b) + (a \cdot c)$

5.

For every element  $x \in B$ , there exists an element  $x' \in B$  such that

$$(a) x + x' = 1$$

$$(b) x \cdot x' = 0$$

6. There exist atleast two elements  $x, y \in B$  such that  $x \neq y$ .

### # Basic Theorems and Properties of Boolean Algebra

①

Duality : It states that every algebraic expression deducible from the postulates of Boolean algebra remains valid if the operators and the elements ~~of the set~~ are interchanged.

Example

$$1) (a) x + 0 = x$$

$$(b) x \cdot 1 = x$$

$$2.) (a) x + x' = 1$$

$$(b) x \cdot x' = 0$$

### Basic Theorems

6 Theorems of Boolean algebra and 4 of its postulates are list in the following table.

Table : Postulates and Theorems of Boolean Algebra

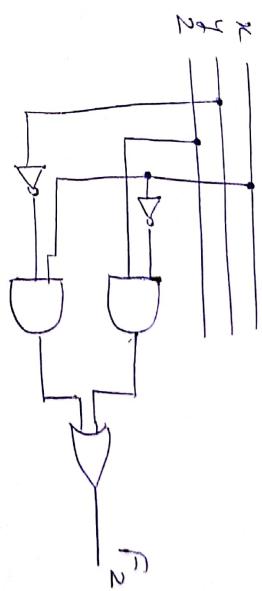

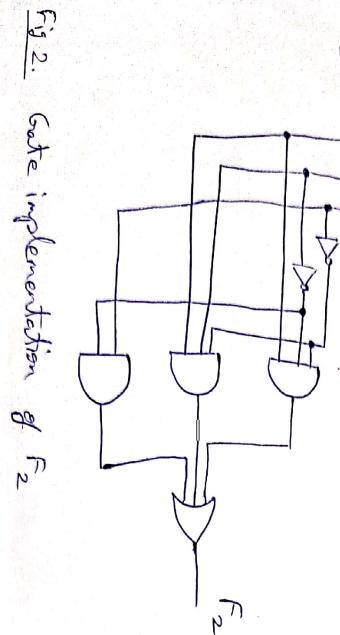

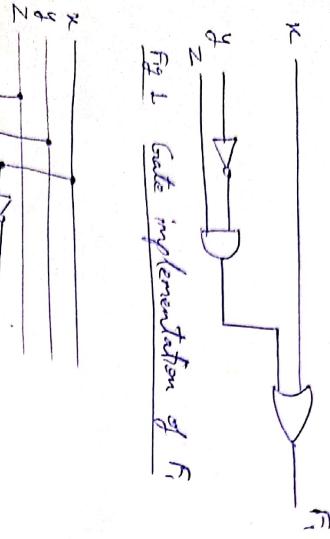

|                           |                                 |                               |
|---------------------------|---------------------------------|-------------------------------|
| Postulate 2               | (a) $x + 0 = x$                 | (b) $x \cdot 1 = x$           |
| Postulate 5               | (a) $x + x' = 1$                | (b) $x \cdot x' = 0$          |
| Theorem 1                 | (a) $x + x = x$                 | (b) $x \cdot x = x$           |
| Theorem 2                 | (a) $x + 1 = 1$                 | (b) $x \cdot 0 = 0$           |
| Theorem 3, involution     | $(x')' = x$                     |                               |
| Postulate 3, commutative  | (a) $x + y = y + x$             | (b) $xy = yx$                 |
| Theorem 4, associative    | (a) $x + (y + z) = (x + y) + z$ | (b) $x(yz) = (xy)z$           |
| Postulate 4, distributive | (a) $x(y + z) = xy + xz$        | (b) $x + yz = (x + y)(x + z)$ |
| Theorem 5, De Morgan      | (a) $(x+y)' = x'y'$             | (b) $(xy)' = x'y'$            |
| Theorem 6, absorption     | (a) $x + xy = x$                | (b) $x(x+y) = x$              |

Rao (2009), Switching and Logic Design. | Practical Applications:<br>Digital Computers<br>Electronic appliances   |                       |       |       |       |       |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |
|   | Summary:  |                       |       |       |       |       |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |

- A Boolean function can be transformed from an algebraic expression into a circuit diagram composed of logic gates connected in a particular structure.
- The logic diagram is also called a schematic.

Note, according to the rules of Boolean algebra, the Boolean function  $F_2$  can be simplified as:

$$\begin{aligned}
 F_2 &= x'y'z + x'yz + xy'z \\
 &= x'z(y' + y) + xy' \\
 &= x'z + xy'
 \end{aligned}$$

#### Advantage

- Fewer gates
- Fewer wires
- Reduces the cost
- Simpler circuit

Note : (1) Function  $F_2 = x'y'z + x'yz + xy'$  has 3 terms and 8 literals.  
 (2) Function  $F_2 = x'z + xy'$  has 2 terms and 4 literals.

| 1. C. V. S. Rao (2009). Switching and Logic Design.   |  |                          |

- Complement of a function  $F \cdot F'$  and is obtained from an interchange of 0's for 1's and 1's for 0's in the value of  $F$ .

The complement of a function can be derived algebraically through De Morgan's Theorems.

Let  $F = A + B + C$ , then

$$\left\{ \begin{array}{l} F' = (A + B + C)' \\ = A \cdot B \cdot C' \end{array} \right\} \text{ or } \left\{ \begin{array}{l} \bar{F} = \overline{A + B + C} \\ = \bar{A} \cdot \bar{B} \cdot \bar{C} \end{array} \right\}$$

- The generalized form of De Morgan's Theorems states that the complement of a function is obtained by interchanging AND and OR operations, and complementing each literal.

### Examples

- Find the complement of the functions using De Morgan's Theorem

$$(a) F_1 = x'y'z' + x'y'z \quad (b) F_2 = x(y'z' + yz)$$

$$\begin{aligned} \text{Solt (a)} \quad F_1' &= (x'y'z' + x'y'z)' \\ &= (x'y'z')' (x'y'z)' \\ &= (x+y+z)(x+y+z) \\ &= (x+y+z)(x+y+z) \end{aligned}$$

$$(b) F_2' = [x(y'z' + yz)]'$$

$$= x' + (y'z' + yz)'$$

$$= x' + (y+z)(y'+z')$$

$$= x' + yz' + y'z$$

2) Find the complement of functions using Duality Principle.

$$(a) F_1 = x'y'z' + x'y'z \quad (b) F_2 = x(y'z' + yz)$$

$$\text{Solt (a)} \quad F_1 = x'y'z' + x'y'z$$

$$\text{The dual of } F_1 \text{ is } (x'+y+z')(x'+y'+z) \\ \text{Complementing each literal, we get} \\ (x+y'+z)(x+y+z') = F_1'$$

$$(b) F_2 = x(y'z' + yz)$$

The dual of  $F_2$  is  $x+(y'+z')(y+z)$

Complementing each literal, we get  
 $x' + (y+z)(y'+z') = F_2'$

| Reference Books: | <p>1. C. V. S. Rao (2009),<br/>Switching and Logic Design,</p>  |   |                          |           |   |   |           |           |   |   |   |                          |       |   |   |   |                    |       |   |   |   |                    |       |   |   |   |              |       |   |   |   |                    |       |   |   |   |              |       |   |   |   |              |       |   |   |   |        |       |

Note: Each max term is the complement of its corresponding minterm and vice-versa.

⇒ A Boolean function can be expressed algebraically from a given Truth Table.

Table 2: Given Truth Table for 3 variables

| x | y | z | Function $f_1$ | Function $F_2$ |
|---|---|---|----------------|----------------|
| 0 | 0 | 0 | 0              | 0              |
| 0 | 0 | 1 | 1              | 0              |
| 0 | 1 | 0 | 0              | 0              |
| 0 | 1 | 1 | 0              | 1              |
| 1 | 0 | 0 | 1              | 0              |
| 1 | 0 | 1 | 0              | 1              |
| 1 | 1 | 1 | 1              | 1              |

$$f_1 = m_1 + m_4 + m_7$$

$$= \bar{y}z + \bar{y}z' + \bar{y}z$$

$$F_2 = M_0 \cdot M_1 \cdot M_4$$

$$= (x+y+z)(x+y+z')(x+y'+z)(x'+y+z)$$

Note: Total no. of functions formed with 'n' variables

$$= 2^{2n}$$

Meaning: Let's say  $n = 2$ , then

$$2^{2n} = 2^{2 \times 2} = 16$$

Total 16 functions can be formed with 2 variables

## Sum of Products (SOP's)

- Each of the  $2^{2n}$  functions of 'n' binary variables can be expressed as sum-of-products (SOPs).

- To express a Boolean function as a SOPs, it must be brought into a form of AND terms.

Example: Express the Boolean function  $f = A + B'C$  as a sum of minterms or SOPs.

Sol. Given,  $f = A + B'C$

This function has 3 variables.

$$\begin{aligned} f &= A(B+B')(C+C') + B'C(A+A') \\ &= (AB+AB')(CC+C') + AB'C + A'B'C \\ &= ABC + ABC' + \underline{AB'C} + \underline{AB'C'} + \underline{AB'C} + A'B \\ &= ABC + ABC' + AB'C + AB'C' + A'B'C \end{aligned}$$

$$\begin{aligned} f &= m_1 + m_4 + m_5 + m_6 + m_7 \\ &= \bar{y}z + \bar{y}z' + \bar{y}z + \bar{y}z' + \bar{y}z \\ &\therefore f = \sum(m_1, m_4, m_5, m_6, m_7) \quad (\because x+x = 1) \end{aligned}$$

or

$$f = \sum(1, 4, 5, 6, 7)$$

$$\begin{aligned} \therefore f(A, B, C) &= \sum(m_1, m_4, m_5, m_6, m_7) \\ &= \sum(1, 4, 5, 6, 7) \end{aligned}$$

$$\Rightarrow F = M_0 M_2 M_4 M_5$$

Also,  $F(A, B, C) = \overline{\prod} (M_0, M_2, M_4, M_5)$   
 $= \overline{\prod} (0, 2, 4, 5)$

Note ①  $\Sigma$  denotes the ORing of minterms, and the numbers are the minterms of the function.

②  $\Pi$  denotes the ANDing of maxterms, and the numbers are the maxterms of the function.

#### \* Conversion between Canonical Forms

The complement of a function expressed as the sum of minterms equals the sum of minterms missing from the original function. For eg -

$$① \text{ Given, } F(A, B, C) = \Sigma (1, 4, 5, 6, 7)$$

Then the complement of this function is expressed as -

$$F'(A, B, C) = \Sigma (0, 3, 3) = m_0 + m_2 + m_3$$

Now, if we take the complement of  $F'$  by DeMorgan's Theorem, we get

$$F = (m_0 + m_2 + m_3)' = \overline{\#} (1, 3, 5, 7)$$

$$= m'_0 \cdot m'_2 \cdot m'_3$$

$$= M_0 M_2 M_3$$

$$= \overline{\prod} (0, 2, 4, 5)$$

(\*) Note: To convert from one canonical form to another, interchange the symbols  $\Sigma$  and  $\Pi$ , and list those numbers missing from the original form.

Example: Make Truth Table for the Boolean expression  $F = xy + x'z$ . Find canonical forms.

| Sol. | x | y | z | F |
|------|---|---|---|---|
|      | 0 | 0 | 0 | 0 |
|      | 0 | 0 | 1 | 1 |
|      | 0 | 1 | 0 | 0 |
|      | 0 | 1 | 1 | 1 |
|      | 1 | 0 | 0 | 0 |
|      | 1 | 0 | 1 | 0 |
|      | 1 | 1 | 0 | 1 |
|      | 1 | 1 | 1 | 1 |

$$F(u, y, z) = \sum (1, 3, 5, 7)$$

$$F(u, y, z) = \overline{\prod} (0, 2, 4, 5)$$

## # Other Logic Operations

- We know that for 'n' binary variables, there are  $2^{2^n}$  functions. Let  $n = 2$ , the no. of possible Boolean functions is 16.

- The truth tables for the 16 functions formed with 2 binary variables are listed in table below :-

| A | B | $F_0$ | $F_1$ | $F_2$ | $F_3$ | $F_4$ | $F_5$ | $F_6$ | $F_7$ | $F_8$ | $F_9$ | $F_{10}$ | $F_{11}$ | $F_{12}$ | $F_{13}$ | $F_{14}$ | $F_{15}$ |
|---|---|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|----------|----------|----------|----------|----------|----------|
| 0 | 0 | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 1     | 1     | 1     | 1        | 1        | 1        | 1        | 1        | 1        |
| 0 | 1 | 0     | 0     | 0     | 0     | 1     | 1     | 1     | 0     | 0     | 0     | 0        | 1        | 1        | 0        | 0        | 1        |
| 1 | 0 | 0     | 0     | 1     | 1     | 0     | 0     | 1     | 1     | 0     | 0     | 1        | 1        | 0        | 1        | 0        | 1        |
| 1 | 1 | 0     | 1     | 0     | 1     | 0     | 1     | 0     | 0     | 1     | 0     | 1        | 0        | 1        | 0        | 1        | 1        |

- The 16 functions can be expressed algebraically by means of Boolean functions, as shown in the first column of the table below.

Note! The Boolean expressions are simplified to their minimum number of literals.

#### Reference Books:

- C. V. S. Rao (2009). Switching and Logic Design,

Summary:

The 16 functions listed can be subdivided into

3 categories -

- 1) Two functions that produce a constant 0 or 1
- 2) Four functions with unary operations: complement and transfer.
- 3) Ten functions with binary operations: AND, OR, define eight different operations: AND, OR, equivalence, inhibition, NAND, NOR, XOR, equivalence, inhibition, and implication.

### Digital Logic Gates

- It is easier to implement a Boolean function with AND, OR, and NOT logic gates.
- Factors to be weighted in considering the construction of other types of logic gates are -
  - ① The feasibility and economy of producing the gate with physical components.
  - ② The possibility of extending the gate to more than two inputs
  - ③ The basic properties of the binary operator, such as commutativity and associativity,
  - ④ The ability of the gate to implement Boolean functions alone or in conjunction with other gates.

Table 1. Digital Logic Gates

| Name                               | Graphic Symbol                    | Algebraic Function             | Truth Table  |

## Positive and Negative Logic

- Hardware digital gates are defined in signal values such as H and L.
- choosing the high-level H to represent logic 1 defines a positive logic system.
- choosing the low-level L to represent logic 0 defines a negative logic system.

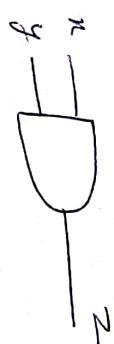

Logic value      Signal value

Logic value      Signal value

(a) Positive Logic

Positive Logic AND Gate

| x | y | z |

Hamming code for BCD word 0110 is 0110011

Method 1: By three parity checkers, the values of  $P_1, P_2, P_3$  are fixed for even parity at positions 1, 3, 5, 7,  $P_1 = 1$  for even parity at positions 2, 3, 6, 7,  $P_2 = 1$  for even parity at positions 4, 5, 6, 7,  $P_3 = 0$

Method 2: For the determination of three parity bits ( $P_1, P_2$  &  $P_3$ ), bit position numbers of the bits are noted and their data place if's are placed are noted and their binary equivalents are taken.

$$\begin{array}{r} 6 \quad 1 \quad 1 \quad 0 \\ 5 \quad 1 \quad 0 \quad 1 \\ \hline 0 \quad 1 \quad 1 \end{array}$$

$$\begin{array}{r} 6 \quad 1 \quad 1 \quad 0 \\ 5 \quad 1 \quad 0 \quad 1 \\ \hline 0 \quad 1 \quad 1 \end{array}$$

(Ex-OR operation)

∴ Resultant is the three parity bits

$$P_3 \quad P_2 \quad P_1$$

Now the seven-bit Hamming code is-

$$\begin{array}{r} 7 \quad 6 \quad 5 \quad 4 \quad 3 \quad 2 \quad 1 \\ D_u \quad P_3 \quad P_2 \quad P_1 \quad 0 \quad P_2 \quad P_1 \end{array}$$

$$\begin{array}{r} 7 \quad 6 \quad 5 \quad 4 \quad 3 \quad 2 \quad 1 \\ 0 \quad 1 \quad 1 \quad 0 \quad 1 \quad 1 \quad 1 \\ 2^{\text{nd}} \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \\ 3^{\text{rd}} \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \end{array}$$

∴ The error position  
 $C_1 C_2 C_3 = 011$  (3<sup>rd</sup> place)

∴ The error position  
 $C_1 C_2 C_3 = 011$  (3<sup>rd</sup> place)  
 So, the error has occurred at 3<sup>rd</sup> position ~~bit~~.  
 This bit is complemented for correction.

The correct word is      0110011

Method 2: Take binary equivalents of 1's placed at bit positions and take their Ex-OR  
 $\rightarrow 011$  (3<sup>rd</sup> place)

Q.2 A Hamming code constructed in even parity is received as 0110111.  
 Find the error position & give the correct word.
